

METHOD AND APPARATUS FOR SEMI-BLIND CHANNEL ESTIMATION

ABSTRACT

5 In a multi-channel communication system (300) data (306) and pilot data (308)
are combined to provide a composite signal comprising discrete data signals (405), each
having a data portion (407) and a pilot data portion (409). The composite signal is
transmitted and a corresponding composite signal received on a communication channel
having varying characteristics. An added pilot semi-blind (APSB) channel estimator
10 (320) and equalizer (330) apply a converging iterative process to estimate the
characteristics of the communication channel and the transmitted data.
